

SAFETY BARRIER WALL PROTECTOR

Flexible Wall Protection Barriers effectively protect production, storage areas from landslides of stacked goods. Plastic protection barriers are combined in a modular way and customized according to individual customer needs. Flexible Wall Protector barriers provide an excellent level of protection at various heights.

The products are tested by the TÜV Rheinland unit and have been certified for safety.

Application:

Protection of machines, walls, buildings, separation of transport routes, protection of production and storage areas, separation of high storage zones

MATERIAL PROPERTIES

DATA

Temperature range	-35°C to +60°C
Special version for freezer rooms	On request
Fire class	HB
Completely non-flammable version V0	On request
Toxicity	No risk
Meets requirements	HACCP, FDA
Corrosion resistance	High
Biodegradability	Yes, 100%

Recommended producer's inspection **every 12 mths**

Material	Polymeric material	
Dimensions	Width:	from 1000 mm to 2200 mm
	Height:	2000 mm

FIXING

Internal Fixing M30

External Fixing
M16, M20

Available version

SAFETY BARRIER WALL PROTECTOR

DIMENSIONS:

Color version

black and yellow
RAL 1003 / RAL 9005

Versions of the base

stainless steel,
galvanized

Polymer strength

Thanks to innovative technology, the barriers have high strength and mechanical flexibility. The ability to bend and then return to their original shape. They retain their structure even after collision with forklifts.

Safe for food

The barriers are waterproof and easy to clean. They are ideal for warehouses storing frozen food and other demanding environments with sanitary rigors.

An investment that pays for itself

The plastic has durable aesthetics and is resistant: to chemicals, humidity, UV, scratches. Barriers do not require cyclic painting and help save money on maintenance.

Ergonomic shape

No sharp edges that affect the risk of damage to pedestrians and vehicles.

Without destroying the floor

The deflection of the barrier takes up most of the impact energy, and it no longer affects the anchorage as much. The anchorage remains stable, and in the event of a strong impact, it behaves in such a way that the floor cracks less as a result.

Dedicated to the food industry

Internal fixing

It works well in environments requiring the highest standards of hygiene (fastening hidden in the pole). The connecting elements of the barrier are hidden from corrosion. It also allows maximum adaptation to the space, even if where the fasteners are close to each other or close to the edges.

Well-suited quality

External fixing

The lack of expansion required for anchoring guarantees low risk of damage to the substrate and makes the fastener ideal for installations near edges and adjacent anchors. It also works well in temporary conditions - it can be completely dismantled without damaging the floor.

Weather resistant galvanizing / stainless steel galvanizing

Recommended for:

- C25 cracked concrete
- C30 cracked concrete

Most resistant to very high loads, including dynamic: vibration, vibration

M30

M16, M20

Recommended for:

- Non-cracked concrete / Cracked concrete C20/25-C50/60
- Reinforced, unreinforced concrete

High strength parameters in cracked uncracked concrete

Barriers with reinforced strength

From the need to adapt to the dynamics of the space, the HD+ version of the product was created, different from its basic version. It is characterized by a stronger structure, mounting, larger profile diameter and correspondingly increased impact resistance of the walls.

Modularity

Pedestrian barriers can be freely combined with other types of Anter System barriers, both in terms of height and purpose. Modularity allows them to be freely: combined, moved, expanded or adapted to changing conditions in warehouses and on production lines.

Additional mounting options

Slide Plate makes it possible to extend the barrier, in an area where it is necessary to maintain access to certain zones. For example: access to machinery, switchgear for maintenance work.

Biodegradability

The products were created in accordance with the philosophy of caring for the environment. They are 100% reusable for barrier production. With the future of our planet in mind, production processes are based on CSR and ESG principles.

Reducing the carbon footprint

By using flexible barriers, you support your company's environmental and ESG strategy.

Effectively reduce CO₂ emissions

5x less than the production of steel barriers

You support appropriate energy consumption

polymer materials yield twice the amount of product from 1 t of raw material (comparing with steel ones)

You reduce the generation of waste associated with the production process

Flexible barriers weigh less than steel ones. Lightweight shipments support reduced fuel consumption during transportation, reduced greenhouse gas emissions and more environmentally friendly logistics operations.

COMPREHENSIVE SECURITY FEATURES

Column protection visible to the driver, adapted to the shape of the infrastructure and the height of the vehicles

RAL4 COLUMN PROTECTION

Protective posts with a reinforced structure and a base that stably withstands the force of pressure. Safeguards that allow access to technical equipment.

PROTECTION POLE PA

They create unusual passageways by connecting to barriers of various types. Safe transfer windows for operators at gates and protection at mezzanines.

BARRIER GATE PROTECTOR
